

Workshop Manual Gol 2009 ➤ Fox 2004 ➤

Troubleshooting, Mechanical Transmission

Edition 04.2008

Technical information should always be available to the foremen and mechanics, because their careful and constant adherence to the instructions is essential to ensure vehicle road-worthiness and safety. In addition, the normal basic safety precautions for working on motor vehicles must, as a matter of course, be observed.

30 – Clutch - control system

Complaints related to clutch and clutch control

Note

Checking the clutch drive ⇒ page 10.

Before carrying out any repairs on the clutch, it is always necessary to check the customer's complaint and trace the problem cause. When doing this, check whether the complaint is related to the clutch or the selection mechanism adjustment is causing the problem.

Repair action indicated in this troubleshooting programme must be carried out as described in the respective repair manuals.

Complaints	Fault description	Corrective action
The clutch pedal does not return to its initial position.		Top up the reservoir with brake fluid, and bleed the clutch system of the clutch system
	 The master cylinder or the slave cylinder are getting stuck. Pipes master cylinder or slave cylinder are leaking 	Replace defective parts, bleed clutch system.
	• Return spring (if incorrectly fit- ted).	Reposition the return spring Replace the return spring, if necessary.
T like.	Actuator elements in the clutch case are gripped.	Clean and lubricate actuators. Replace actuators, if necessary.
n part or i	 The clutch bearing is askew in the guide tube, causing wear. 	 Replace guide tube and clutch bearing.
purposas,	 The diaphragm spring for the clutch plate pressure plate is broken. 	Replace the clutch plate.

Complaints	Fault description	Corrective action
The drive pressure on the clutch pedal is very high	The clutch pedal is getting stuck. Before checking, separate the master cylinder from the clutch pedal.	Clean and lubricate the bear- ings. Replace the bearings, if necessary.
	 The limiting spring's housing is getting stuck; the limiting spring is defective 	 Clean and lubricate the housing. Replace the housing if necessary. Replace the limiting spring.
	 Return spring, if incorrectly adjusted (very strong). 	 Reposition return spring.

Complaints	Fault	description	Corrective action
	inc	e clutch's release pressure creases due to wear of pack- gs (linings) of the clutch disc.	- Explain the situation to the customer (the release pressure grows as wear increases) - Replace the clutch disc if the distance between the disc surface and the rivet is less than 0.1 mm
		e actuator element in the utch case is getting stuck.	Clean and lubricate actuators. Replace actuators, if necessary
	♦ Th	e clutch bearing is askew in e guide tube, causing wear.	Replace the defective parts. AG. Volkswagen AG. de-
	the	e contact surface between e clutch bearing and the re- ase lever is worn/marked	- Replace the defective parts.
	◆ The sp tio	e plates pressure plate ring kas incorrect specifica- n.	 Obtain the appropriate part according to the ⇒ Electronic parts catalogue.
	Solal purposes, in part or in who selected in the selected i	e clutch disk gets stuck / is ack in the hub groove.	- Check possible damage in the hub grooves (burrs). Replace the clutch disc, if necessary. - Remove corrosion and lubricant deposits in the hub splines and the input shaft splines, and lubricate with grease -G 000 100 See the ⇒ Chemicals Manual. Displace the clutch disc forwards and backwards, and remove excess grease.
Complaints	Fault description	Corrective action	
Noise when step- ping on the clutch	 Clutch pedal gets stuck, points are out of alignment. Limiting spring dry, stuck or misaligned 	- Clean and lubricate the bearings. Replace the bearings, if necessary.	A nagewellov ydritynygo, jingritygo
	 The return spring (if incorrectly in- stalled) makes noises. 	Grease the bear- ing points.	
	Defect in the clutch release	Always replace noisy release	

Complaints	Fault description	Corrective action
Noise when step- ping on the clutch	 Clutch pedal gets stuck, points are out of alignment. Limiting spring dry, stuck or misaligned 	Clean and lubricate the bearings. Replace the bearings, if necessary.
	The return spring (if incorrectly in- stalled) makes noises.	Grease the bearing points.
	Defect in the clutch release bearing; the release bearing's guide tube is not OK; contact surface is worn.	 Always replace noisy release bearings. Replace the guide tubes if damaged.

Complaints	Fault description	Corrective action
	◆ Defect in the contact surface (diaphragm spring ends) of the plate's pressure plate (bent, broken). Clutch bearing decentralised.	Corrective action Replace the clutch plate. Check and, if necessary, replace the clutch bearing and the guide tube. Check the release lever's position. Check the centralisation pins. Replace and lubricate with MoS2 grease. Check the cen-
	◆ Defect in the % crankshaft need die bearing (∰ fitted). Engine	Check the centralisation pins. Replace and lubricate with MoS2 grease.
<u> </u>	transmission misaligned.	Check the centralisation pins. Correct the installation position.
	The wrong clutch disc was instal- led.	 Obtain the appropriate clutch disc according to the ⇒ Electronic parts catalogue.
Complaints	Fault description	Corrective action
when a forward or reverse gear is se-	 The brake fluid level is too low. There is air in the system, the clutch did not come out completely. 	- Check the system, top up brake fluid, bleed the system Check the system.
	 Leak in the mas- ter/slave cylinder and tubes, line is too elastic. 	fective part, top
	 Clutch pedal has not enough trav- el (carpet or mat under pedal), the clutch is not completely de- pressed. 	uation to the cus- tomer.

Complaints	Fault description	Corrective action	
	 Plate's pressure plate is uneven due to defective installation; clutch disc is bent due to in- correct handling. 	 Check parts, replace as necessary, check the position of the centralisation pins. If the problem persists, check the clutch dischard splines in the input shaft for 	
		the input shaft for ease of move-ment; check the crankshaft needle bearing; carry out repairs to the transmission, if necessary.	
	Clutch plate spring ends broken or bent (defective installation, clutch bearing misaligned).	- Check and, if necessary, replace the clutch bearing and the guide tube. - Check the cen-	OBS NOT GUARANTOR OF ARTHUR AND
part or in whole, is n	The clutch disc is very thick.	tralisation pins. - Obtain the appropriate clutch disc according to the ⇒ Electronic parts catalogue.	
mercial purposes, In	The clutch disc is very thick. Packing (lining) gripped/locked on the flywheel (parked for a long time, high humidity level).	- File lightly the clutch disc's friction surfaces or, if there is a lot of corrosion, replace the part.	

Complaints	Fault description	Corrective action	
	◆ Clutch disc gets stuck in / ad- heres to the groove. Corro- ded hub, dam- aged during in- stallation. Hub	Check possible damage in the hub grooves. Replace the clutch disc, if necessary.	
	profile mis- aligned on one side.	 Remove corrosion and grease deposits from the hub and from the shaft. Lightly lubricate the shaft with graxa - G 000 100 	
		Displace the clutch disc forwards and backwards, and remove excess grease.	
		Check the position of the centralisation pins if the hub profile is misaligned, AG, Vol.	kswagen AG _{does} a
	Se like tribes auth	Dheck and, if necessary, replace the clutch bearing, the guide tube, the clutch plate and the needle bearing.	kswagen AG does not guarantes of acceptable leading.
	The plate's pres- sure plate does not lift high enough (incor- rect clutch plate).	 Obtain the appropriate clutch plate according to the ⇒ Electronic parts catalogue. 	
	Defect in the crankshaft needle bearing (if fitted). The input shaft is lifted by the crankshaft whenever the clutch is de-	dle bearing and	DA nageweallo V youngingo Jinanuo de sa
	pressed.	- Check the centralisation pins Check the input shaft.	altito O iliza de Colonia de Colo

Complaints	Fault description	Corrective action
	♦ Engine/trans- mission exces- sively misaligned (no centralisa- tion pins), caus- ing the clutch disc support plate to bend. Defect in the crankshaft nee- dle bearing (if fit- ted).	- Check the clutch disc, the plate's pressure plate and the needle bearing for dam-
	 Packings (lin- ings) displaced due to excessive speed (shifting downwards at very high speed). 	Replace the clutch disc. Explain the situation to the customer.
	Packings are displaced because the clutch skids too much as it pulls away. Amangan A.S. Volkswage	n AG dae

	Johnswagen AG. 4 Sind Wage	I'AG does not
Complaints (Sed 10)	Fault description	Corrective action
The load assembly vibrates when the engine speed accelerates or decelerates suddenly	◆ The assembly is fitted very loose- ly.	Explain the site uation to the customer. Obtain the appropriate assembly according to the ⇒ Electronic parts catalogue, replace if necessary.
	The engine oscillates (does not operate smoothly). The engine oscillates (does not operate smoothly).	Check and cor- rect the engine assembly.
or commercial	The clutch disc is installed with a defective absorber spring (to prevent loose gears from oscillating).	Explain the sit- uation to the cus- tomer.
Sommood of the state of the sta	Defect in the crankshaft needle bearing (if fitted). Engine/fransmission	Replace the needle bearing and lubricate with MoS2 grease. Refer to the ⇒ Chemical Manual Check the centralisation pins, and replace as necessary.

Complaints	Fault description	Corrective action
The clutch skids, with no or little propelling	The plungers of the master and slave cylinders do not return to their initial position.	→ Replace the master/slave cyl-inders. - Replace the brake fluid, and bleed the system.
	♦ Incorrect clutch disc, incorrect clutch plate	 Obtain the appropriate clutch disc and clutch plate according to the ⇒ Electronic parts catalogue.
	Clutch disc worn or burnt; plate's pressure plate overheated, scratched; plate's pressure plate bent due to defective installation, insufficient contact pressure on the plate's pressure plate, steering fault, normal wear.	 Replace the clutch disc. Replace the clutch plate. Explain the situation to the customer.
	Elements of the actuator in the transmission are getting stuck. The pedal mechanism is hard.	Clean and lubricate the bearings. Carry out the necessary repairs.
	◆ Clutch disc, plate's pressure plate, flywheel have oil in excess. The sealing of the engine or transmission shaft is defective. There is grease on the contact surfaces due to excess grease in the hub	 Replace the clutch disc. Clean the contact surfaces, the plate's pressure plate and the flywheel. Replace shaft sealing, remove excess grease from the input shaft
	Clutch disc in- correctly instal- led	Correct installation, check clutch disc, and replace if necessary

Complaints	Fault description	Corrective action	
	◆ The flywheel is very worn or there is too much erosion on the packing's contact surface.	Obtain the appropriate flywheel according to the ⇒ Electronic parts catalogue.	
		 Check the clutch disc and the clutch plate, and replace as nec- essary. 	
	Slave cylinder, clutch bearing are leaking.	Replace the slave cylinder with the clutch bearing.	
Complaints	Fault description Corrective actio		

Complaints	Fault description	Corrective action
The clutch vibrates, the assembly vibrates	◆ There is air in the system, master/ slave cylinder is defective.	- Replace the defective part. - Check brake fluid level, bleed the system, check for leaks.
	The engine does not operate properly	- Check and cor- ect the engine assembly/instal- lation.
	Drive fault, pull- ing away speed very low.	Explain the sit- uation to the cus- tomer.
	The wrong clutch disc was installed.	 Obtain the correct clutch disc according to the ⇒ Electronic parts catalogue.
	◆ The assembly is very loosely fit- ted and mis- aligned.	Obtain the appropriate assement by according to the ⇒ Electronic parts catalogue.
	 Clutch packing (lining), plate's pressure plate contact surface and flywheel have excess oil (oil leaking from the clutch case). 	Check the seal- ing of the trans- mission input shaft or of the crankshaft, and replace as nec- essary.
		 Replace the clutch disc, clean the plate's pres- sure plate and the flywheel.

Complaints	Fault description	Corrective action	
	The clutch bearing is askew in the guide tube, gripped (pressure on one side on the clutch plate diaphragm spring).	 Replace the clutch bearing and the guide tube. Check the actuator elements and their bearings. 	
	 ♦ The contact surface for the plate's pressure plate only lifts on one side due to the skewed position of the release bearing. ♦ The housing for the plate's pressure plate got bent during assembly. The contact surface of the plate's pressure plate in pressure plate in as only one side lifted up. 	wheel, the plate's pressure plate and the diaphragm spring:	'AG does not guarantee or aqu
in Dart or in	◆ The input shaft has excess grease (traces of grease on the clutch disc, plate's pressure plate and flywheel).	 Clean the grease from the plate's pressure plate and from the fly- wheel, and re- place if there are signs of damage (vibration marks, overheating signs, scratch- es). 	AG does not guarantee of acoustin the correctness of Information in the standard of the correctness of Information in the standard of the stan

	f the tubes/hoses asse /hoses assembly can	
l. The pedal's return t nats or by mats stuff	function must not be of fed under it.	bstructed by additiona

- 4. The pedal's return function must not be obstructed by additional mats or by mats stuffed under it.
- 5. Depress the clutch pedal. To do this, the pedal must be depressed and held in five different positions along its entire travel for approximately 20 seconds (to test different application pressures in the hydraulic system). Then, a second person checks whether any fluid is leaking at any of the positions mentioned in item 2. The first holding position also permits to verify whether the clutch pedal falls by itself when pressure is maintained.

- 6. Remove the slave cylinder and check for brake fluid presence in the bellows.
- 7. If all tests appear to be OK or if item 6 tests positive, replace the slave cylinder.

Note

In transmissions in which the slave cylinder and the clutch bearing form one unit, the transmission must be removed.

Drive, housing

Complaints related to the selection mechanism

Before carrying out any repairs on the selection mechanism, it is always necessary to check the customer's complaint and trace the problem cause. While doing this, check whether the complaint's cause can in fact be traced to the selection mechanism or to its adjustment. It may be necessary to check whether the complaint's cause lies in the clutch and in the clutch drive <u>⇒ page 1</u>.

Repair actions listed in this troubleshooting programme must be carried out as described in the relevant repair manuals.

Complaints	Fault description	Corrective action
There are noises when a forward or reverse gear is selected; the selection mechanism gets stuck; it is not possible to select a gear; the clutch is not working	ment.	Checking and correcting.
	The selection mechanism is not lubricated or is misaligned.	Grease the selection mechanism and replace defective parts.
	◆ Defect in the grankshaft needle bearing (if fitted). The input shaft is lifted by the crankshaft when- ever the clutch is depressed.	
	 Defect in the transmission's syn- chronization and/or selection mechanism. 	 Carry out repairs to the trans- mission.

Complaints	Fault description	Corrective action	
Thumping noise when the clutch pedal is in rest position.	 Idling / primary shaft have sud- den vibrations. The cogs rattle. The clutch disc's absorber 	Explain the situation to the customer.	
	spring is broken.	 Replace the clutch disc.
